## R Lab 2: Working with Objects and Functions

Ikuma Ogura

August 21, 2019

## Today

- Using R as Calculator
- Object
  - ► Object class/type
- Functions

### Using R as Calculator

```
5 + 3 \# summation
## [1] 8
4 - 7 # substration
## [1] -3
5 * 6 # product
## [1] 30
7 / 3 # division
## [1] 2.333333
```

## Using R as Calculator (cont.)

```
7 %% 3 # modular (residual)

## [1] 1

2 ^ 6 # power

## [1] 64

(2 + 5) * 4 + 2 ^ 3 # note the order of calculation

## [1] 36
```

## Object

- In R, we store information as an object. Once we create an object, we can
  refer it to its name.
- We assign values to an object using the assignment operator <-.
  - ► We can also use = for assignment (although not recommended)
- Object class/type
  - what kind of information is stored in the object and how it is stored
  - typeof() or class() command to see the object type

## Object Class/Type

- Data types
  - Character: character strings
  - ▶ Numeric: numbers
  - ► Logical: boolean data (TRUE/FALSE)
  - Factor
- Data structures
  - ▶ **Vector**: a single-dimension sequence of data of the same type
  - Matrix: a two-dimension sequence of data of the same type
  - ▶ Data Frame: a two-dimension structure of data of varying data types
  - List

## Object: Example

```
# Numeric vector
num <- c(4, 2, 6, 8, 5)
# Character vector
program.lang <- c("R", "Python", "C", "Java")
# Logical vector
comparison <- (num >= 5)
comparison
```

## [1] FALSE FALSE TRUE TRUE TRUE

## Object: Example (cont.)

```
# Object class/type
class(num)

## [1] "numeric"

class(program.lang)

## [1] "character"

class(comparison)
```

## [1] "logical"

# **Logical Operators**

Operator	Meaning
>	greater than
<	less than
>=	greater than or equal to
<=	less than or equal to
==	equal to
! =	not equal to
1	or
&	and
is.na()	TRUE if missing
!is.na()	FALSE if missing

### Logical Operators: Example

```
7 < 5

## [1] FALSE

(6 > 4) | (8 < 5)

## [1] TRUE

(7 > 3) & (9 <= 11)

## [1] TRUE
```

### Command/Function

- We use a command/function to perform some tasks on an object/objects
- Argument: the definitions, directions, or objects that are passed to a command/function
- If we specify multiple arguments,
  - separate the arguments by commas
  - it is desirable to specify them along with their names unless they are obvious
    - ★ The code looks like funcname(arg1 = input1, arg2 = input2)
- We can access to function help files either by ?funcname or help("funcname")
  - ▶ However, it is often difficult to understand what the help files are saying..
  - ► Google search, ask others (including me!)...

## Command/Function: Example

```
log(num)
## [1] 1.3862944 0.6931472 1.7917595 2.0794415 1.6094379
sqrt(num)
## [1] 2.000000 1.414214 2.449490 2.828427 2.236068
length(num)
## [1] 5
sum(num)
## [1] 25
```

## Command/Function: Example (cont.)

```
sort(num)
## [1] 2 4 5 6 8
sort(num, decreasing = FALSE)
## [1] 2 4 5 6 8
```

## Command/Function: Example (cont.)

• Output of help("sort")

sort {base} R Documentation

#### Sorting or Ordering Vectors

are removed

#### Description

Sort (or order) a vector or factor (partially) into ascending or descending order. For ordering along more than one variable, e.g., for sorting data frames, see order.

#### Usage

```
sort(x, decreasing = FALSE, ...)
## Default S3 method:
sort(x, decreasing = FALSE, na.last = NA, ...)
sort.int(x, partial = NULL, na.last = NA, decreasing = FALSE,
        method = c("auto", "shell", "guick", "radix"), index.return = FALSE)
```

#### Arguments

х	for sort an R object with a class or a numeric, complex, character or logical vector. For sort.int, a numeric, complex, character or logical vector, or a factor.
decreasing	logical. Should the sort be increasing or decreasing? For the "radix" method, this can be a vector of length equal to the number of arguments in For the other methods, it must be length one. Not available for partial sorting.
	arguments to be passed to or from methods or (for the default methods and objects without a class) to sort.int.
na.last	for controlling the treatment of NAs. If TRUE, missing values in the data are put last; if FALSE, they are put first; if NA, they

14 / 15
